HOUSEKEEPING

- This webinar is recorded and will appear on the RGI website and YouTube channel
- Camera on, microphone off
- Rename yourself to “Name, Organisation”
- If you have a question do the following:

Time	Agenda
11:00	Introduction: RGI, DLR Andrzej Ceglarz (RGI), Bruno Schyska (DLR)
11:05	DestinE: The bigger picture Jörn Hoffmann (ECMWF), Jakub Dąbrowski (DG-CNECT)
11:15	Use Case Energy Systems: Introduction, key results & users' engagement Bruno Schyska (DLR), Andrzej Ceglarz (RGI)
11:40	Use Case Energy Systems: Users' perspective Andreas Zucker (DG-ENER), Laurent Dubus (RTE)
11:50	Open discussion
12:25	Closing remarks Bruno Schyska (DLR), Andrzej Ceglarz (RGI)

DLR

Energy Systems
Analysis

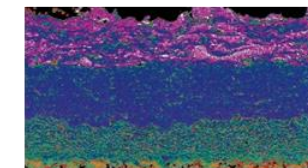

Energy System
Technologies

Solar Energy

Wind Energy

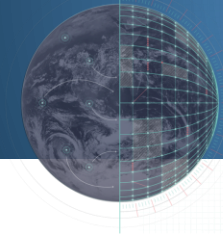

Energy Storage

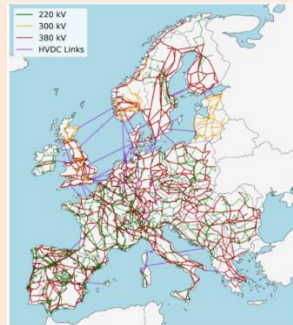

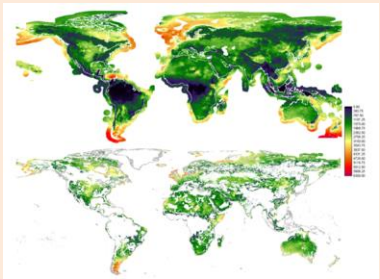

Energy Converters

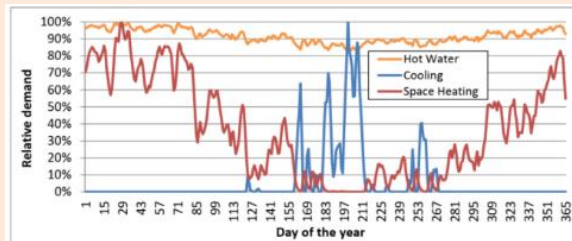

DLR: RESEARCH FIELDS

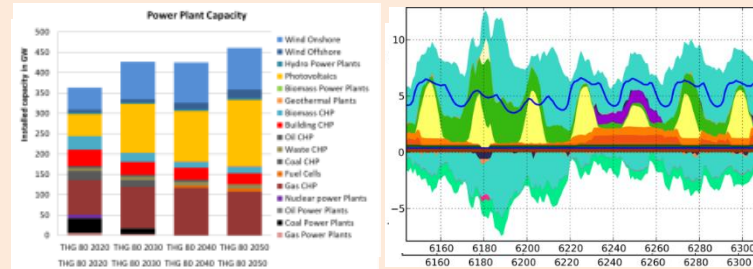

Improvement of the data basis for energy systems modelling

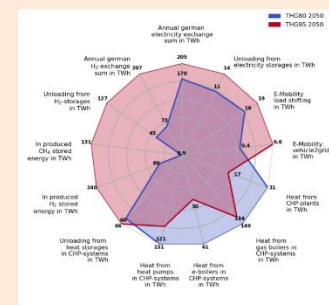

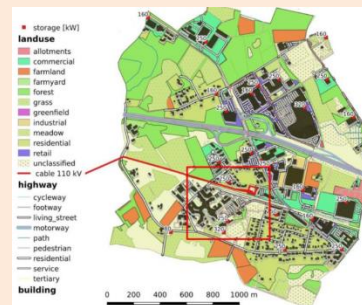

- Energy infrastructure data
- Renewable energy potentials
- Energy demand and its flexibility

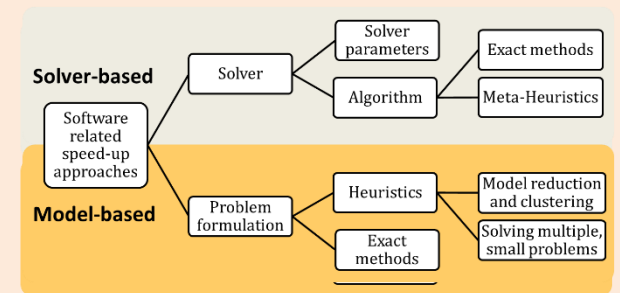

Investigation of energy system transformation pathways

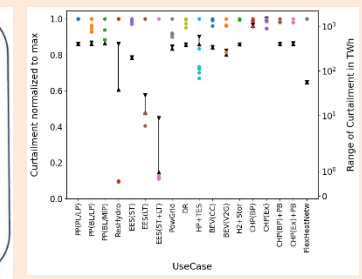

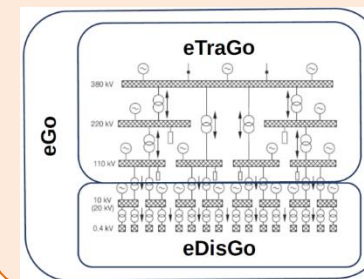

- Modelling national/continental systems
- Storage, transmission, sector coupling
- Resilience and security of supply
- Urban energy systems

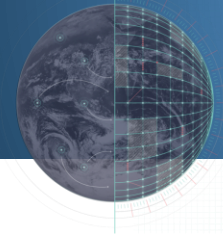

Enhancement of methodological competence

- Reduction of model solution times
- Strengthening robustness (models/data)
- Model coupling and comparison
- Remote sensing and machine learning
- Data management (metadata, ontology)

ABOUT RENEWABLES GRID INITIATIVE

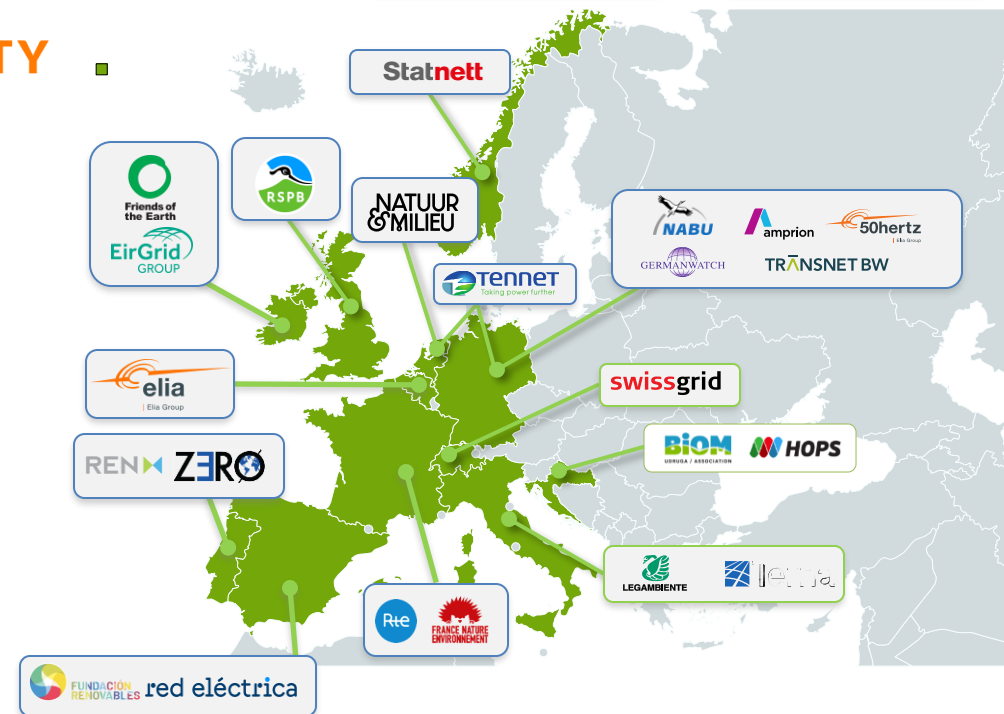

RGI is a unique **collaboration of NGOs and TSOs** from across Europe engaging in an 'energy transition ecosystem-of-actors'. We foster knowledge exchange, discussions on the grid infrastructure needs, and the implementation of best practices within **three dimensions**:

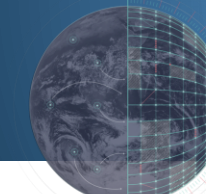

GRIDS & ENERGY SYSTEMS ENERGY & NATURE ENERGY & SOCIETY

We enable discussions on **how to model, plan and implement** decarbonised and optimised clean energy systems, including different voices in the process.

We ensure energy systems both onshore and offshore are developed in **coherence with nature and biodiversity**, promoting mitigation, enhancement and restoration measures.

We **include and engage citizens, civil society and policy makers** on strategies towards full decarbonisation, improving capacity and knowledge on the role of grids within for the energy transition.

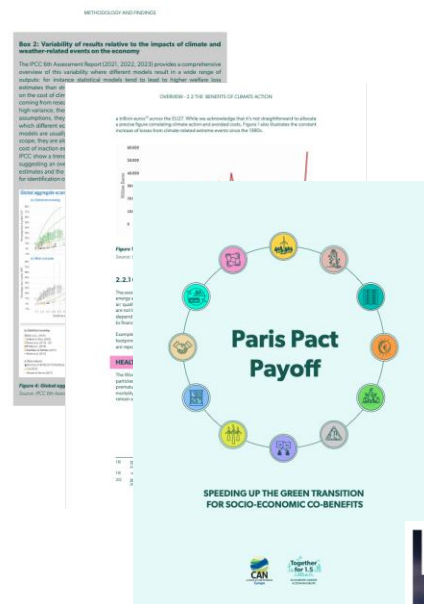

WHY CLIMATE RESILIENCE AND ADAPTATION

C

USE CASE ENERGY SYSTEMS: INTRODUCTION AND KEY RESULTS

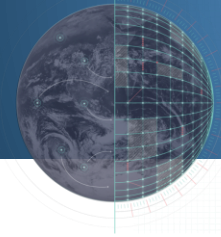

TOOLS AND DATA FOR IMPROVED ENERGY SYSTEMS MODELING WITH DESTINATION EARTH

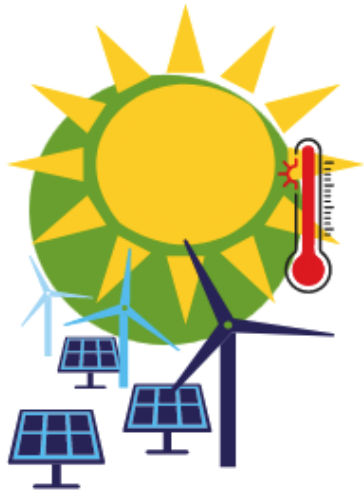

Bruno Schyska

Project Leader, Institute of Networked Energy Systems

DLR

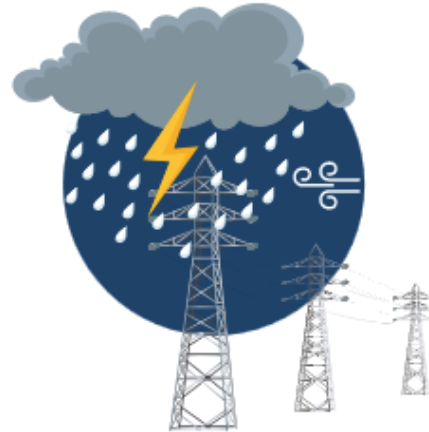

CLIMATE IMPACTS ON ENERGY SYSTEMS

GENERATION

Efficiency and potential of generation assets can be affected.

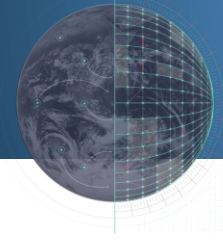

INFRASTRUCTURE

Transmission and distribution electricity grids can be disrupted.

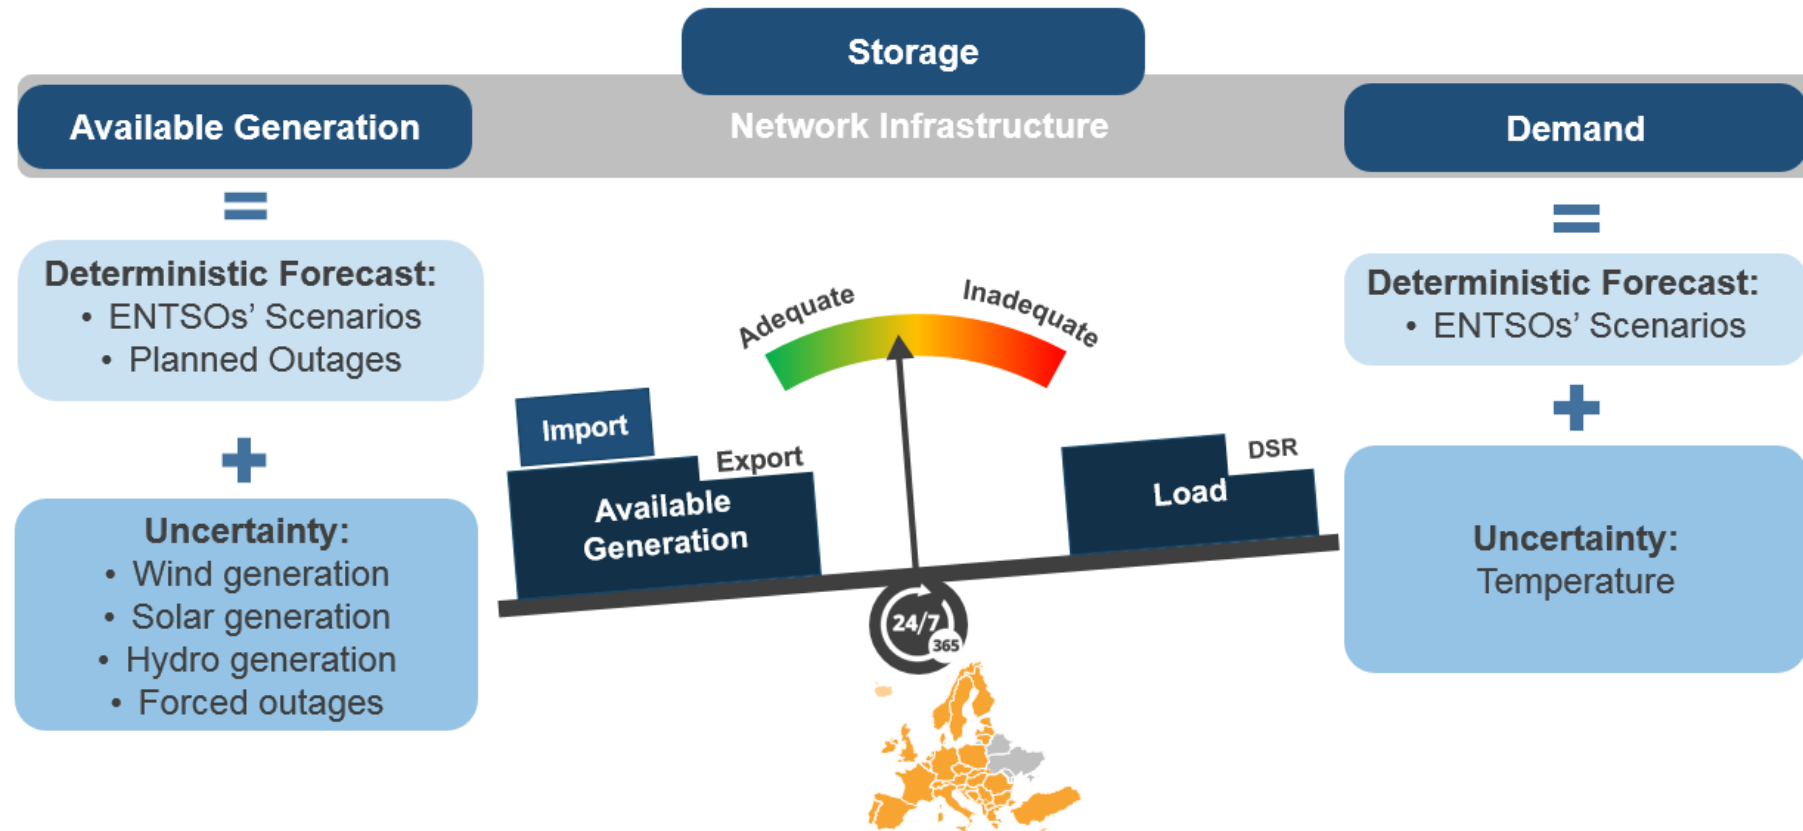

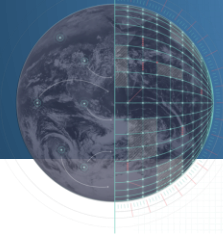

DEMAND

Heating and cooling demands are directly affected by extreme temperatures.

ENTSO-E European Resource Adequacy Assessment (ERAA)

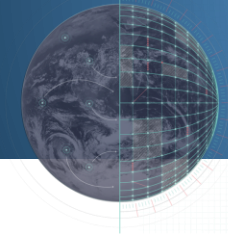

OBJECTIVES OF THE USE CASE ENERGY SYSTEMS

BRIDGING INFORMATION GAP

- Introducing climate and weather data into power/energy system modelling
- Providing more accurate energy system planning
- Contributing to the co-design of the DestinE Climate DT

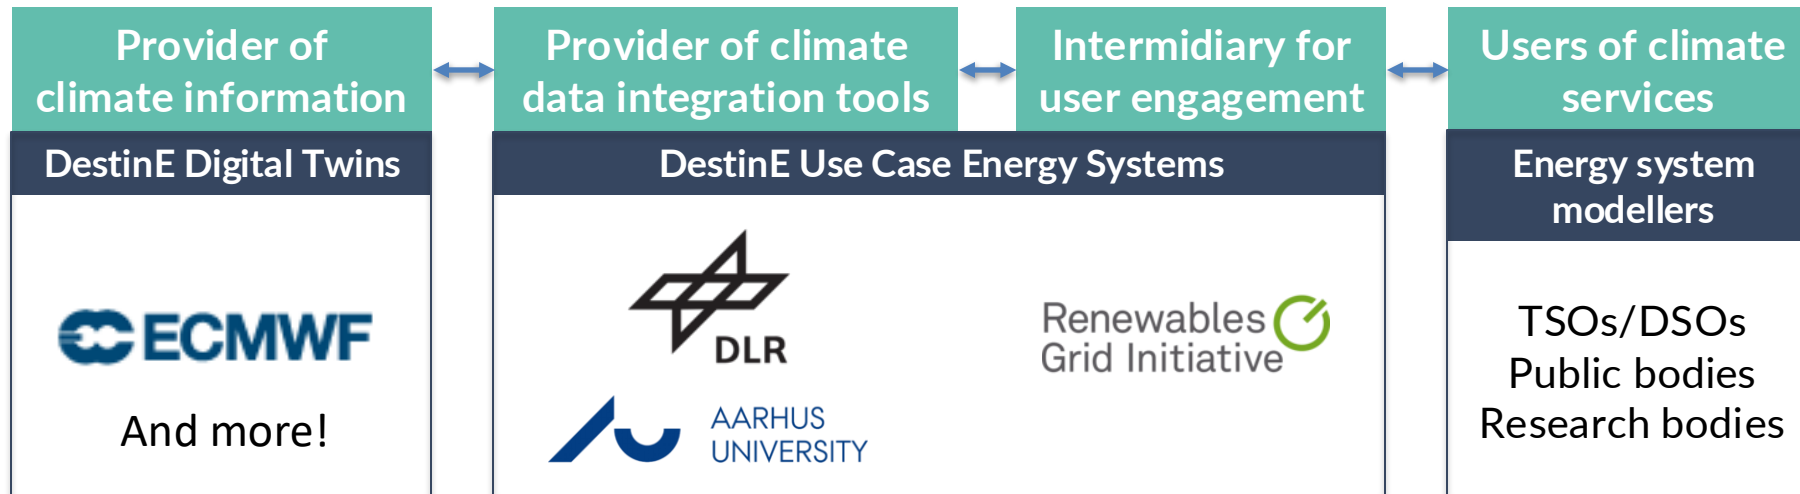

SUPPORT USERS' COMMUNITY

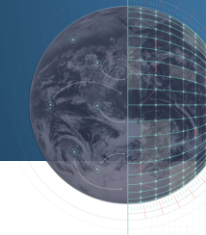

- Providing tools and methods for integration of climate information in energy system models
- Offering guidance and expert knowledge
- Contributing to more informed decision-making process

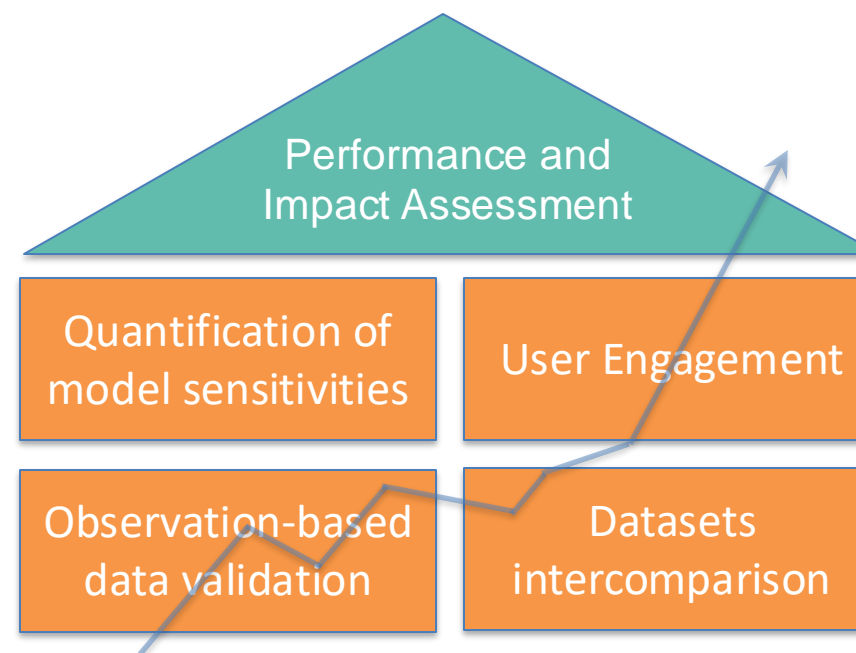

USE CASE ACTORS

CO-PRODUCING CLIMATE INFORMATION

Quality of Climate DT data

CONTRIBUTING TO DESTINE

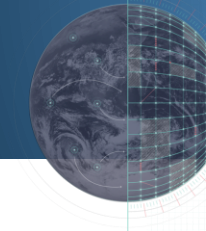

THE DATA

We combine:

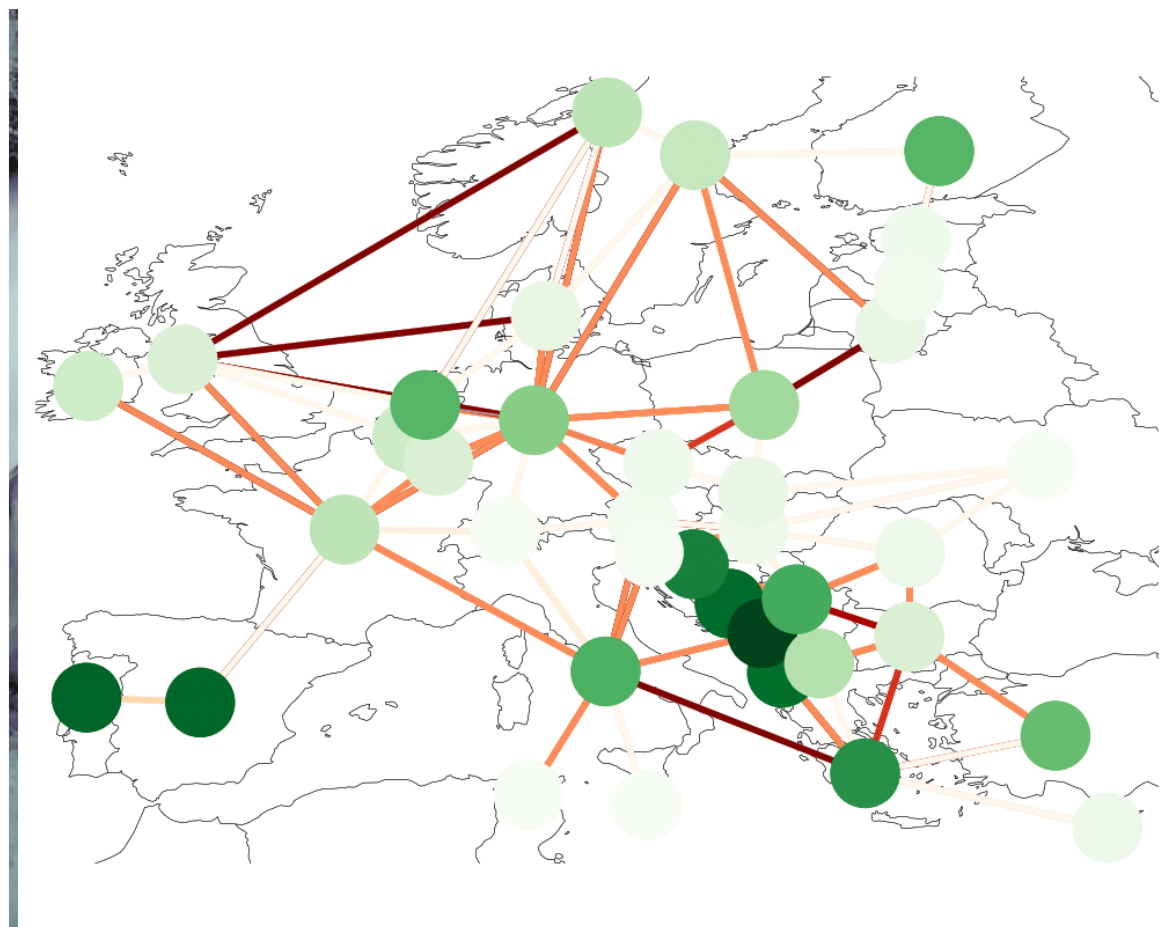

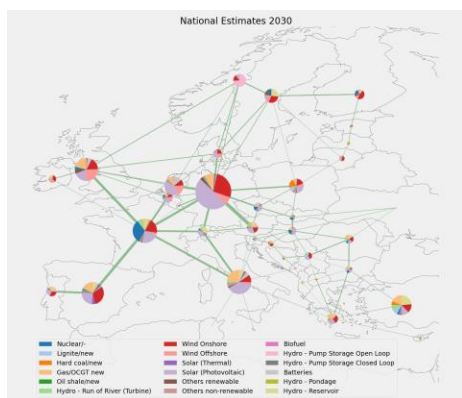

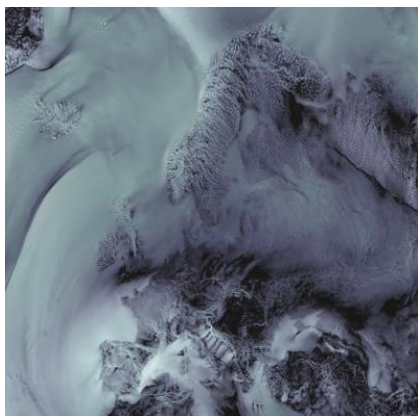

- Databases used by ENTSO-E for the annual *European Adequacy Assessment* (ERAA), namely the PECD and PEMMDB, with
- Time series derived from DestinE's Climate DT,
- Alternative PECD scenarios¹ and
- Further openly available data sets (here: University Reading²)

1) Koivisto, Matti Juhani; Murcia Leon, Juan Pablo (2022). Pan-European wind and solar generation time series (PECD 2021 update). Technical University of Denmark. Collection. <https://doi.org/10.11583/DTU.c.5939581.v3>

2) Bloomfield, Hannah and Brayshaw, David (2021): ERA5 derived time series of European aggregated surface weather variables, wind power, and solar power capacity factors: hourly data from 1950-2020. University of Reading. Dataset. <https://doi.org/10.17864/1947.000321>

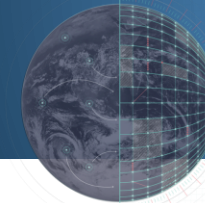

THE DEMONSTRATOR

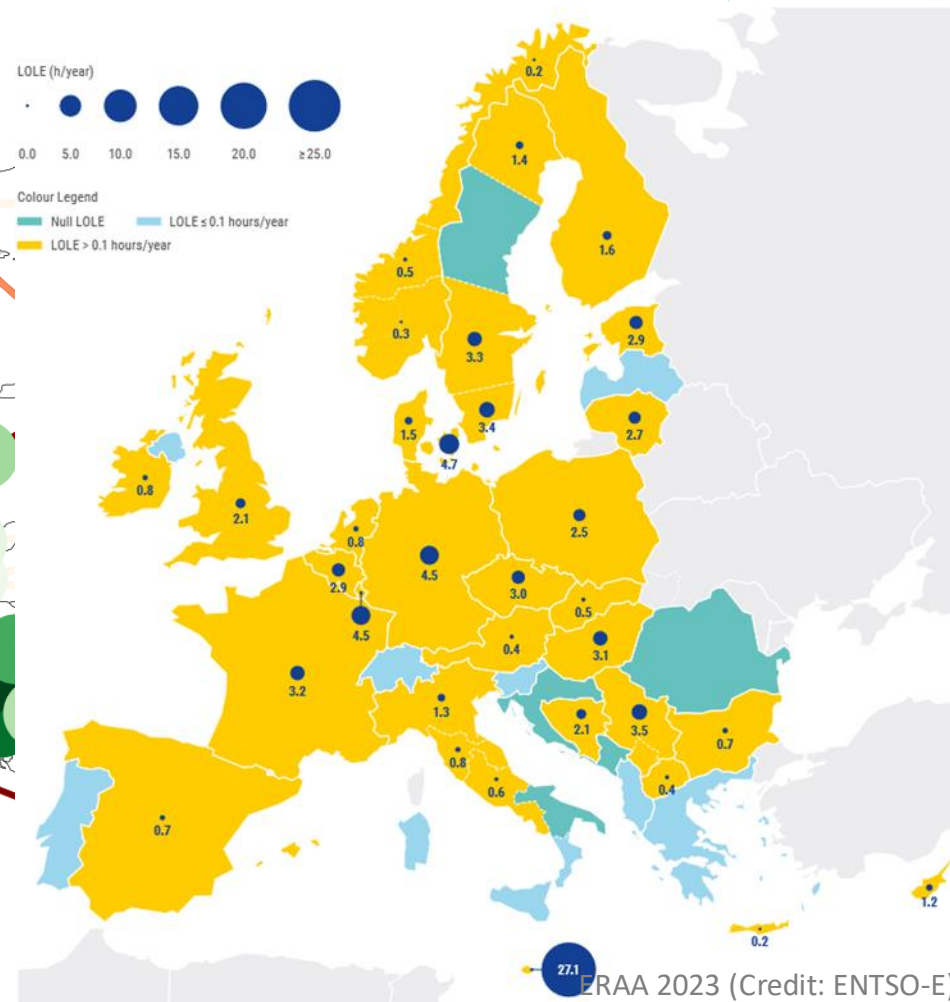

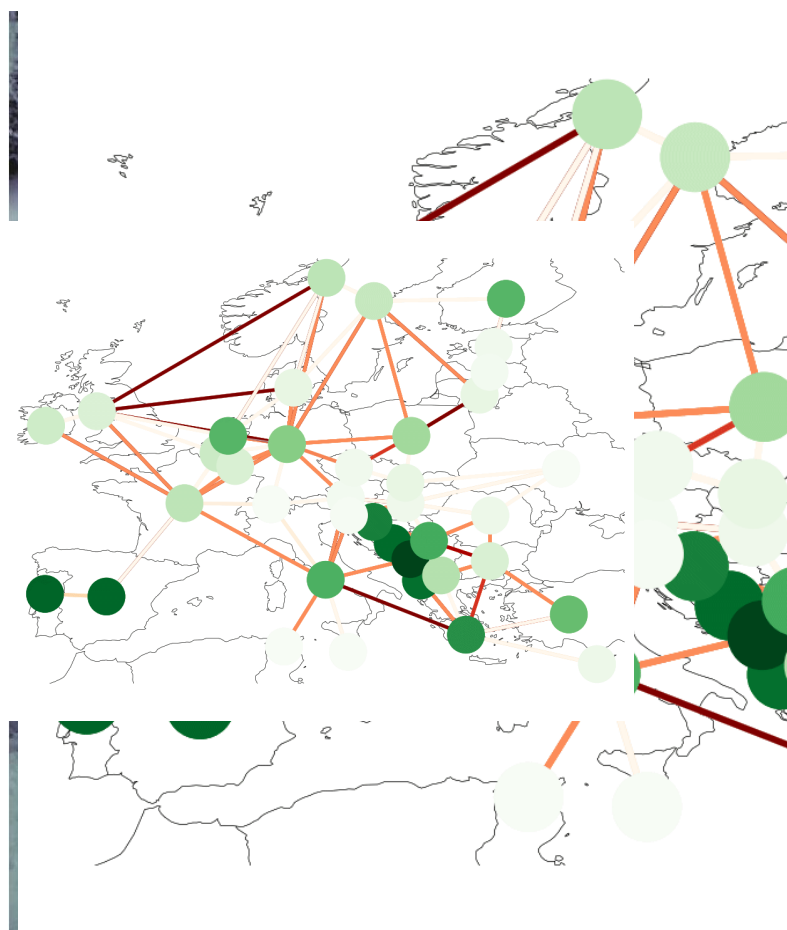

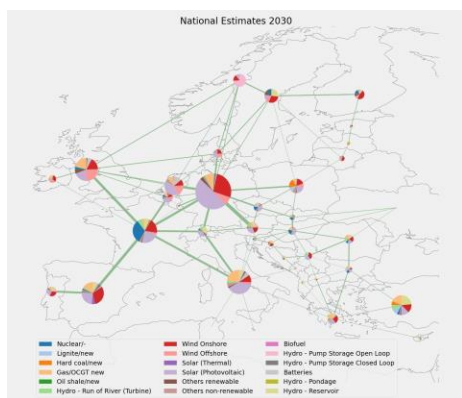

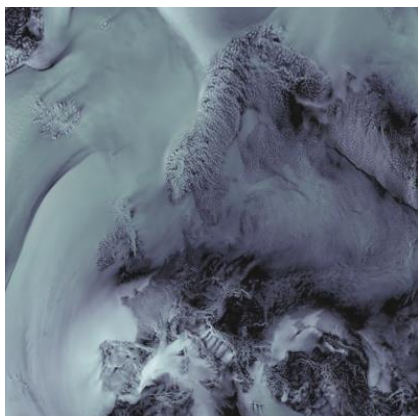

ERAA 2023 (Credit: ENTSO-E)

From information  through simulation  to impact

 ECMWF

THE DEMONSTRATOR

From information

through simulation

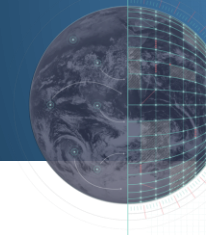

to impact

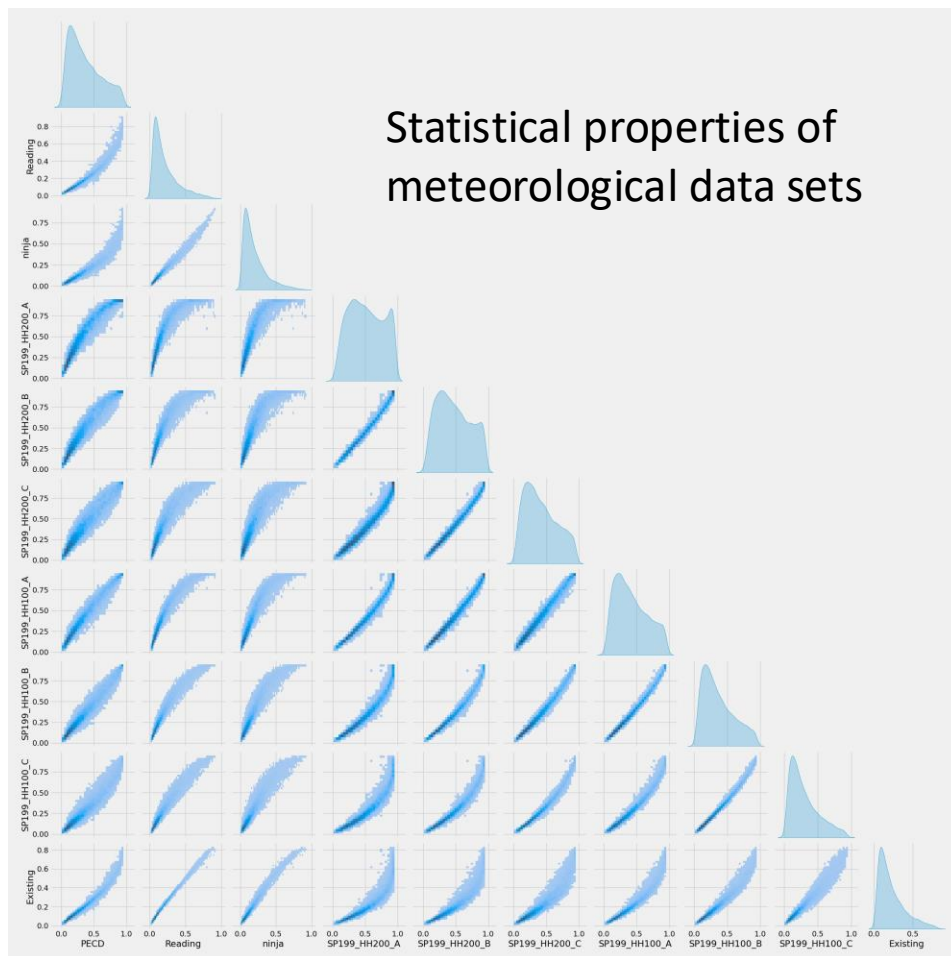

THE TOOLS

1. Demonstrator showcasing the use of meteorological information in a semi-operational power system modeling workflow following the lines of the European Resources Adequacy Assessment¹
2. Standardized assessment of model sensitivities on meteorological parameters linking results of power system simulations to meteorological conditions
3. Validating Climate DT data with high-resolution observations
4. Machine learning to replace expensive and complex linear-optimal-power-flow (LOPF) calculations

¹ implementations are available open-source on GitHub: https://github.com/destination-earth/DestinE_ECMWF_EnSys

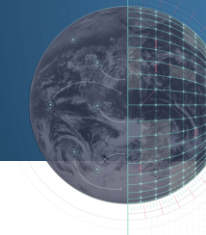

DATASETS INTERCOMPARISON

Meteorological data sets used for power system simulations differ in two major aspects:

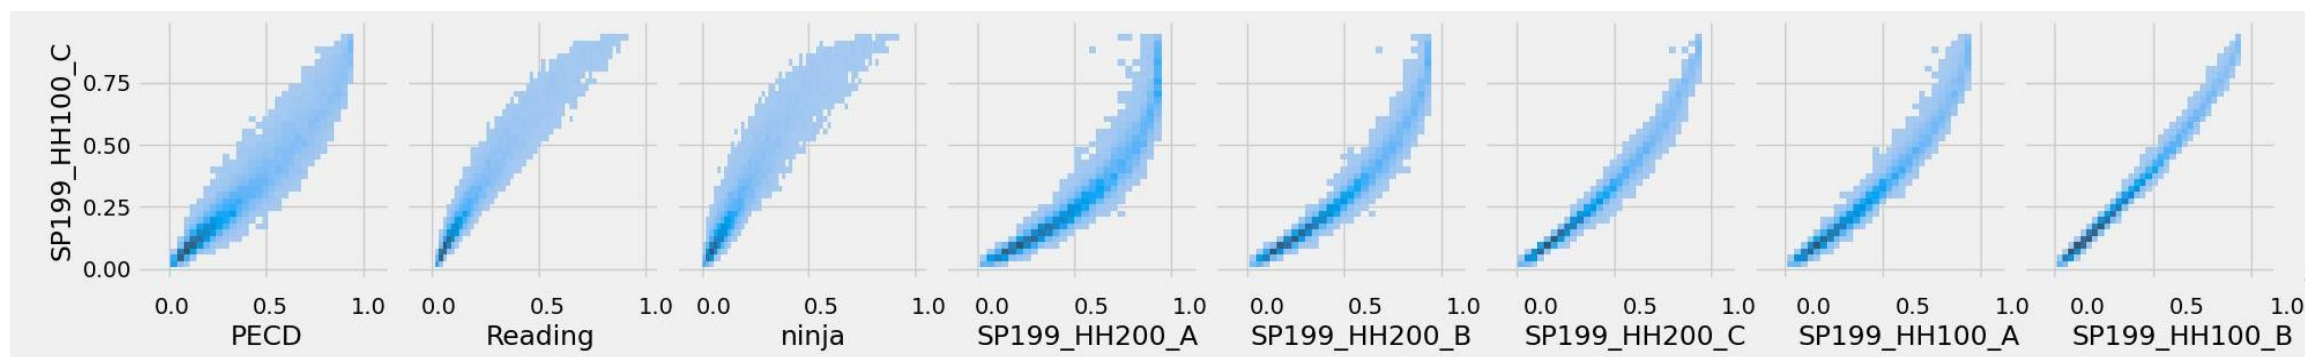

1. The meteorological *basis* (reanalysis vs. climate models vs. observations)
2. The procedure to convert gridded meteorological information to standardized data sets for power systems modeling

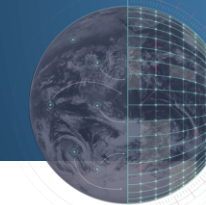

Hourly onshore wind power capacity factors in DE (1985-2015) from 10 different data sets / scenarios.

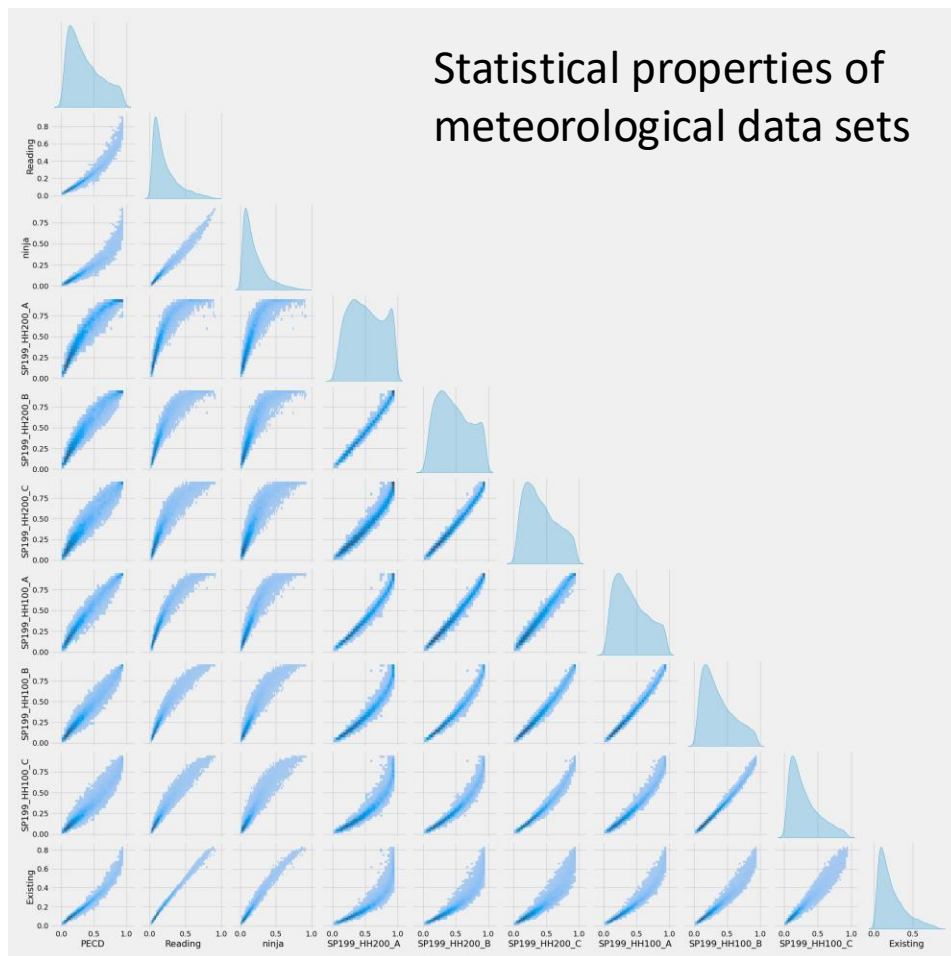

RESULTS

1. There are distinct differences between the meteorological scenarios.

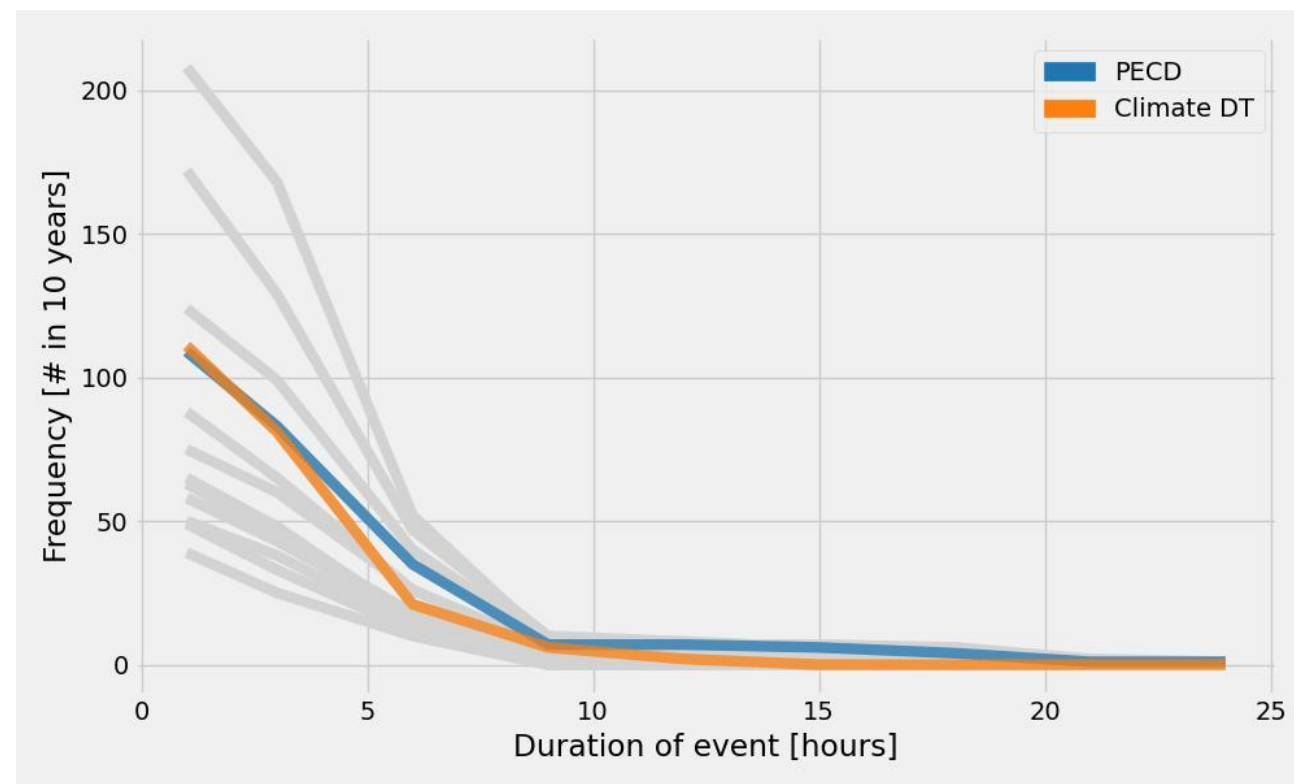

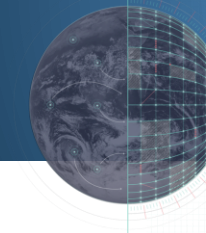

SENSITIVITY ANALYSIS

Simulation results (here: Losses-load-events)

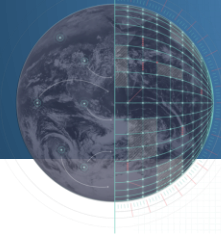

SENSITIVITY ANALYSIS

Scenario / Indicator	Energy Not Served			Loss-of-Load Expectation		
	DE	BE	DK	DE	BE	DK
PECD	0.09	0.02	0.05	53.8	22.9	30.4
Minimum	0.02	0.0	0.0	15.1	6.3	2.3
Maximum	0.19	0.04	0.15	99.8	48.6	68.1
Climate DT	0.07 (4)	0.01 (2)	0.04 (3)	45.0 (5)	9.0 (1)	24.1 (4)

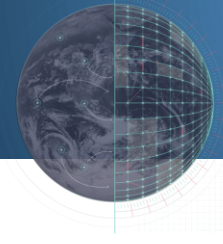

Adequacy Indicators* derived from running the DestinE Energy Systems Demonstrator with 13 different meteorological data sets.

* Our Demonstrator is a simplified implementation of ERAA. Results must not be compared to the official results published by ENTSO-E.

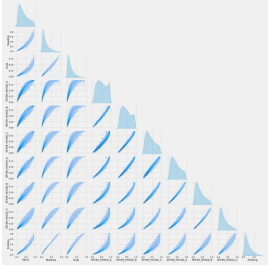

RESULTS

1. There are distinct differences between the meteorological scenarios.
2. The power system reacts sensitive to statistical properties of the meteorological information used for the simulations.

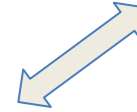

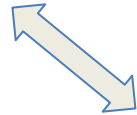

QUALITY ASSESSING DESTINES CLIMATE DT

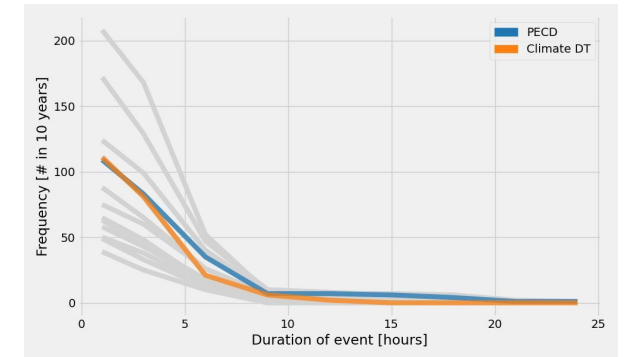

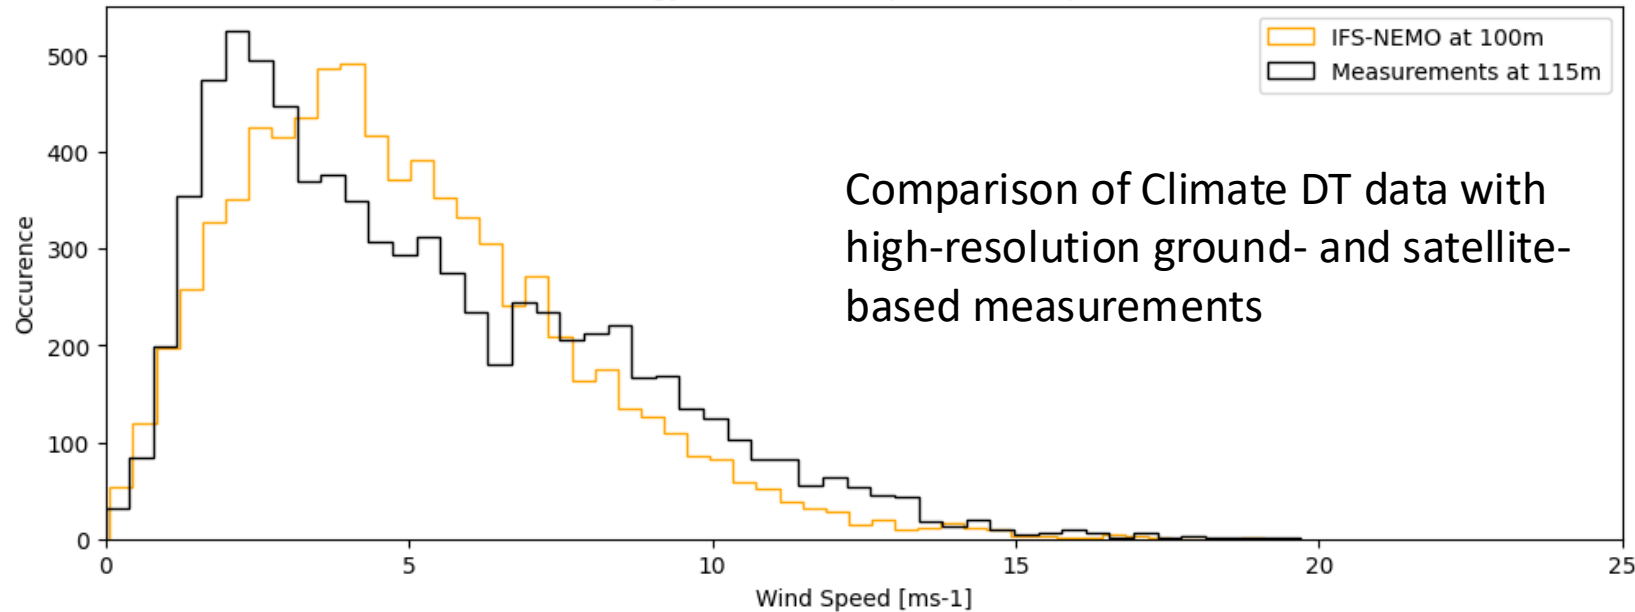

Statistical properties of meteorological data sets

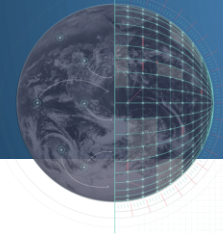

Simulation results (here: Losses-load-events)

Tower hegyhatsal - Wind Speed - #Samples 7656

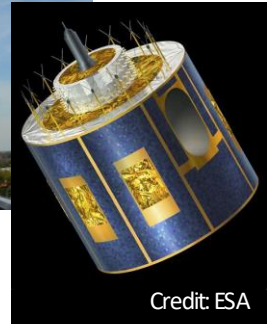

OBSERVATION-BASED DATA VALIDATION

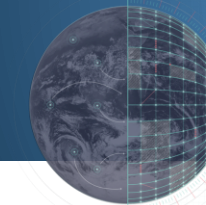

We have performed an observation-based validation of the DestinE ClimateDT data using

- DLR's unique cloud and radiation measurement network [eye2sky](#)
- Long-term measurement timeseries from the *Baseline Surface Radiation Network* (BSRN)
- Satellite-based solar irradiance products (*DLR-Solarleistungsprognose SLP*, *CAMS gridded data v4.5 CRS*)
- Wind measurements from BSC's tall tower data archive¹

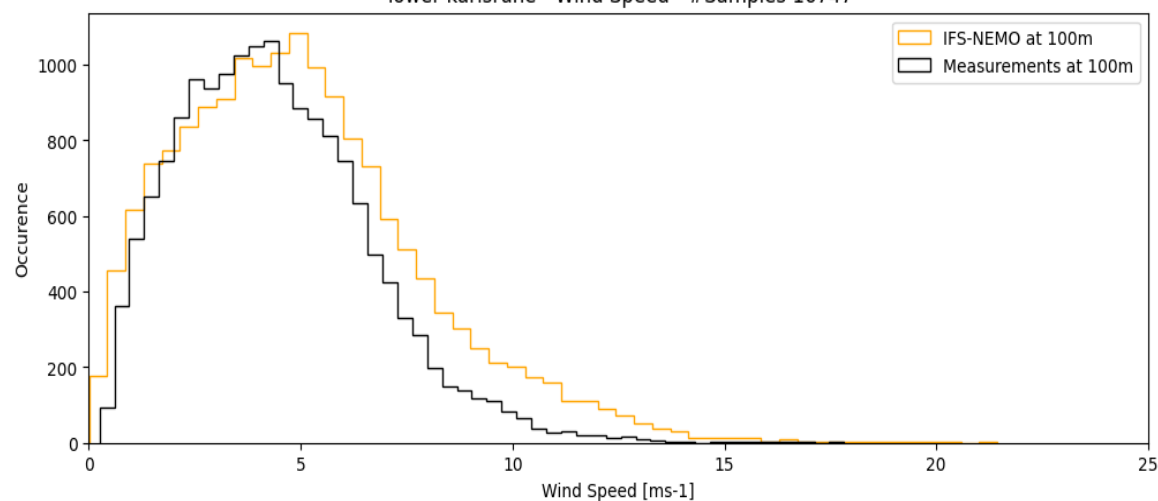

The validation focuses on statistical parameters (mean bias error, data distribution), variability metrics for temporal and spatial patterns with respect to data resolution and a comparison between climate models and observations.

This work is ongoing, results are preliminary.

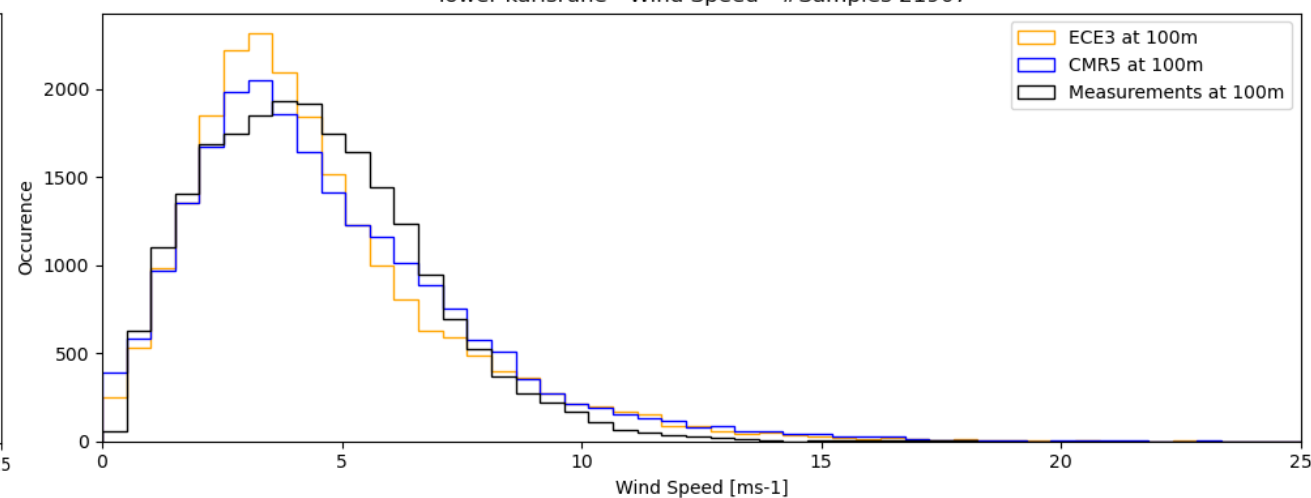

OBSERVATION-BASED DATA VALIDATION

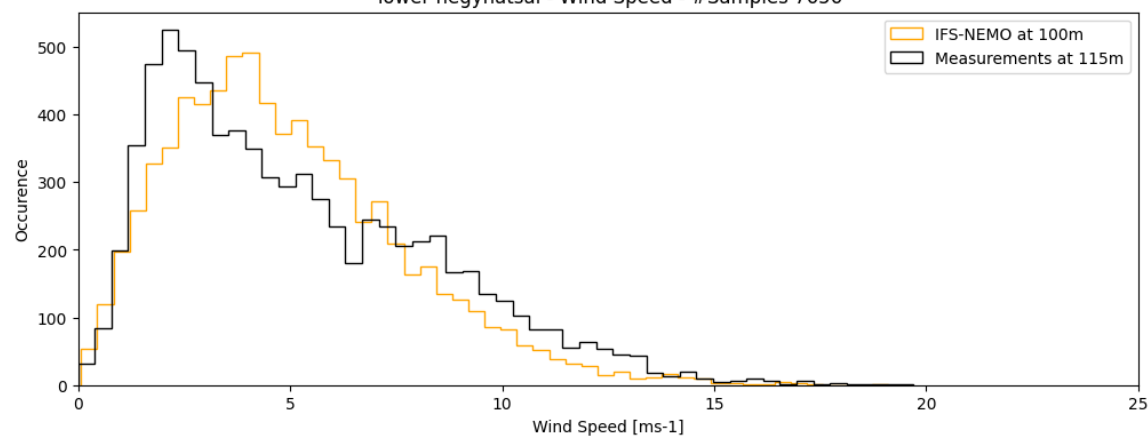

Tower karlsruhe - Wind Speed - #Samples 16747

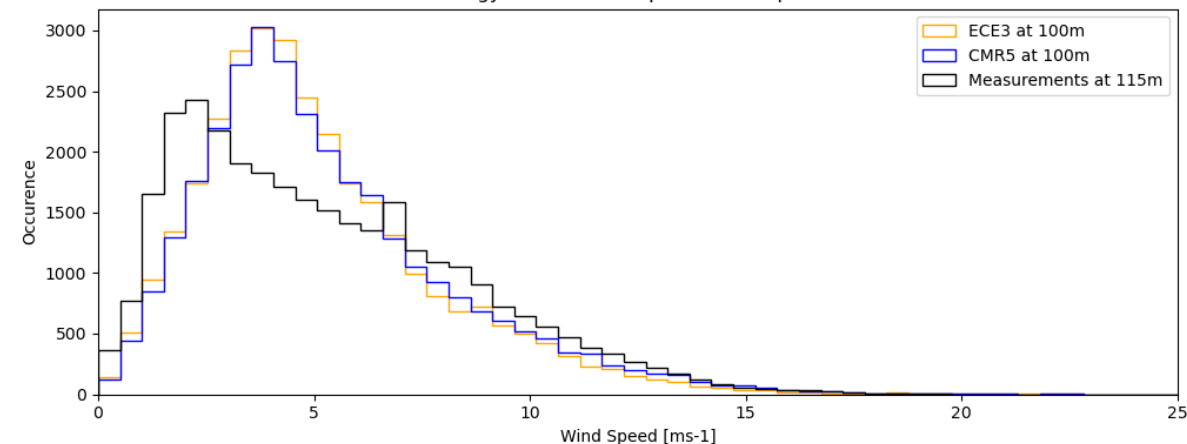

Tower karlsruhe - Wind Speed - #Samples 21907

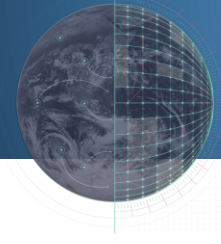

Tower hegyhatsal - Wind Speed - #Samples 7656

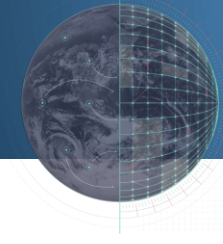

Tower hegyhatsal - Wind Speed - #Samples 31065

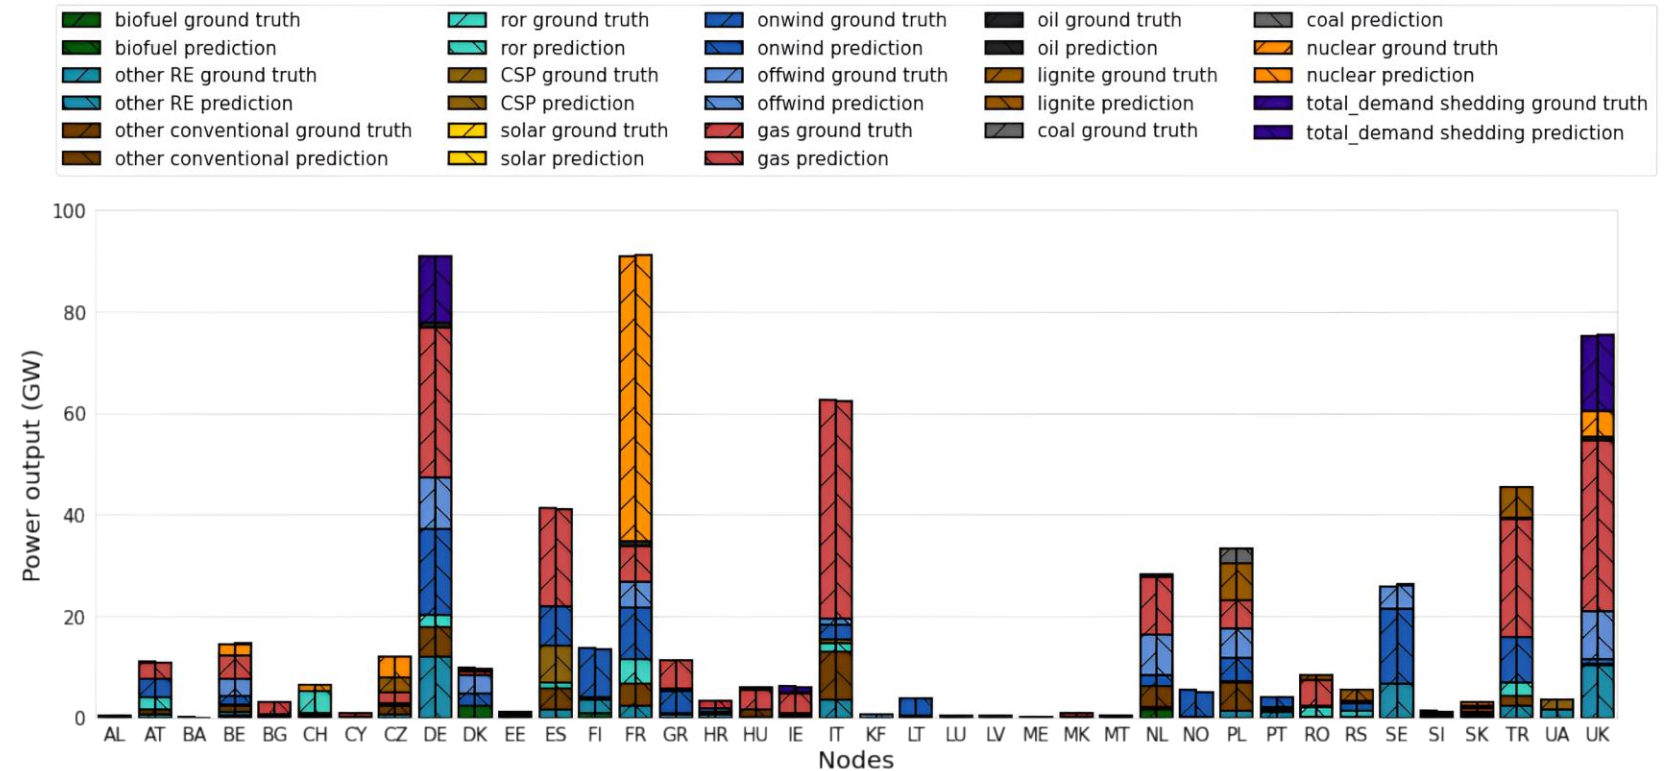

RESULTS

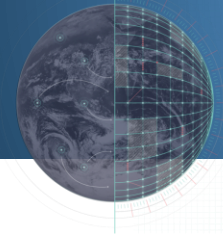

1. There are distinct differences between the meteorological scenarios.
2. The power system reacts sensitive to statistical properties of the meteorological information used for the simulations.
3. The Climate DT shows a comparable high accuracy with respect to the representation of spatial and temporal variability of energy-related variables.

ML PROOF-OF-CONCEPT: RESULTS

- ML model is able to accurately predict the cost-optimal power dispatch in critical situations (occurrence of *lossed load*).
- No expensive optimization is required, computational cost are reduced.

CONCLUSIONS

1. DestinE provides high-quality, state-of-the-art data which should be considered as a data source for power systems simulations.

CONCLUSIONS

DestinE provides

- ✓ 5-10 km resolution
- ✓ Global information with local granularity
- ✓ Regular operational production
- ✓ Bringing earth system models and impact sector models within the same workflow.
- ✓ Platform for bringing together research + industry + policy to turn data and knowledge into action

USE CASE ENERGY SYSTEMS: USER ENGAGEMENT AND CO-DESIGN

OBJECTIVES OF USER ENGAGEMENT

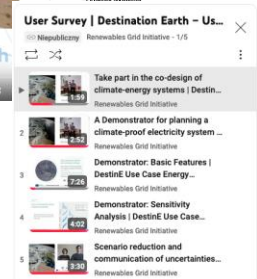

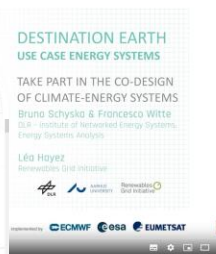

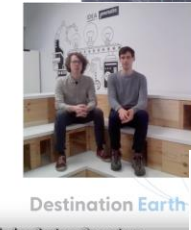

Target audience	Objectives
Grid operators – technical level (planning & operation)	<ul style="list-style-type: none">_Raise awareness about climate adaptation in the context of grid planning_Ensure relevance of the demonstrator to users' practices_Understand users' needs to integrate climate information in their workflows_Collect feedback on modelling development
Grid operators – strategical level	<ul style="list-style-type: none">_Raise awareness about climate adaptation in the context of grid planning_Ensure relevance of the demonstrator to users' practices_Disseminate DestinE objectives & status
The scientific community	<ul style="list-style-type: none">_Disseminate DestinE objectives & status_Collect feedback on modelling development
Public bodies	<ul style="list-style-type: none">_Raise awareness about climate adaptation in the context of grid planning_Disseminate DestinE objectives & status_Collect feedback on modelling development_Inform with required policy adjustments for enabling climate-proof energy systems

USER ENGAGEMENT CO- PRODUCTION ACTIVITIES

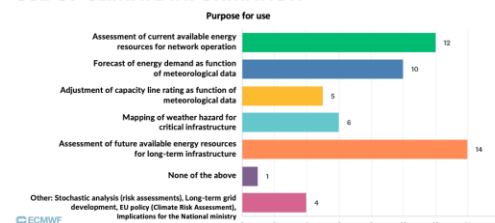

28.02.2023 – User Needs Workshop (Bonn), hybrid, 40 participants

January/February 2024 – online survey (+30 respondents)

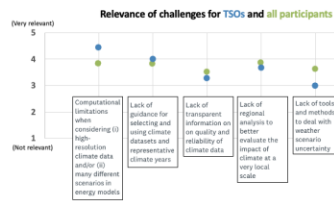

6.02.2024 – User Perspectives Workshop (Brussels), hybrid, 30 participants

USE OF CLIMATE INFORMATION

CHALLENGES TO INTEGRATE CLIMATE INFORMATION

Other challenges:

"Agreement on common data / model / interface standards when working with multiple partners and stakeholders."

"Access to the data itself. A good idea would be to develop something like PyClio but for general climate data."

"Demand data and weather year should ideally match [...] the demand data already includes some supply signals from RES. We need some tools to correct demand signals and do long-term demand bottom-up modelling (stats based / ML supported)"

🤖 Curious about how different sectors can benefit from the Destination Earth (#DestinE) digital twins?

We partnered with more than 100 institutions across Europe for the development of DestinE's #DigitalTwins of the planet. Following a co-design approach means engaging with end users from the start and collecting their feedback, needs and priorities, helping shape this ambitious initiative of the EU (EU Digital & Tech). Many different sectors have already demonstrated the potential added value of DestinE digital twin data.

Examples include:

- 🏠 Management of energy systems or renewable energy production
- 🌊 Disaster risks (floods, storms, wildfires)
- 🏙️ Public health (urban heat stress, air quality)

The first phase of DestinE (2022–2024) demonstrated that it can be a meaningful source of #climate and weather information for different target sectors. In our latest article, we review some key developments of our DestinE partnerships and use cases during phase 1. Find out more

Destination Earth (DestinE): Towards co-design of climate-energy models

On 28 February, RGI organised a "User Needs" workshop on how energy system modellers and operators can enhance the use of climate information in their workflows. The hybrid workshop was attended by a group of 40 experts representing several user perspectives, including TSOs, DSOs, researchers in energy and climate modelling, and representatives of the European Commission.

This activity was developed within the Destination Earth (DestinE) Use Case Energy Systems, led by the European Centre for Medium-Range Weather Forecasts (ECMWF) and the German Aerospace Center (DLR). As a DestinE partner, RGI will co-design innovative methods and tools to improve the climate resilience of the energy system together with model users.
